

Slow Internet Connection in Bridged Network Mode

• Parallels Desktop for Mac Standard Edition

Symptoms

WiFi Internet Connection is slow or drops down when using Bridged Network Mode in Parallels Desktop for Mac Virtual Machines.

Cause

The most probable reason is that the Wireless Network you are using blocks receiving separate IP address for your virtual machine.

Resolution

This issue was discovered on wireless networks based on Cisco wireless controller solutions. If you are using a Cisco Equipment and need to use Bridged Network Mode, please contact Cisco Support directly. The problem can potentially occur with other equipment manufacturers - please contact your system administrator to reach out to manufacturer's support.

For the meantime, we can offer a workaround to switch the Virtual Machine Network Adapter to Shared Mode:

- 1. Access virtual machine configuration
- 2. Click on **Hardware > Network**.
- 3. Change the **Source** to **Shared Network**:
